

## Cognitive Vitality and Brain Health: Acquired Brain Injury

**In 2009–2010, an estimated 98,440 people, 2.4% of the population aged 12 and over, sustained a head injury. Of those, 57% (55,910) were working-age adults, 23% (22,720) were adolescents, and 20% (19,810) were seniors.**

### Research

Researchers at Parkwood Institute were instrumental in creating the best review of Acquired Brain Injury research in the world.

The Evidence-Based Review of Acquired Brain Injury (ERABI) provides a continually updated review of research on therapeutic interventions for moderate to severe ABIs from traumatic and non-traumatic causes. The ERABI is the most comprehensive review of ABI literature and serves as a powerful platform for developing key guidelines, educational modules and teaching case studies, clinical implementation of best practices, and international collaborations. This tool is used extensively by researchers, healthcare professionals, students, and funders.

The ERABI is critical for the application of best evidence in ABI in Ontario, Canada and internationally.

The ERABI team includes researchers in London, Toronto and Ottawa.
